AMENDMENTS TO THE CLAIMS:

This listing of claims will replace all prior versions, and listings, of claims in the application:

Listing of claims:

Claim 1 (currently amended) Mould assembly including a first mould part (2) and a second mould part (4) for moulding a substantially elongated, closed profile member, in particular a wind turbine blade of fibre-reinforced polymer, said mould assembly further including:

a hinge mechanism (6) with a hinge line (7) extending parallel to the two mould parts in the longitudinal direction of the mould to allow turning of the mould parts in relation to each other between a first, open position, in which the opening of one or 10 preferably both at least one of the mould parts faces upwards, and a second, partially closed position, in which the second mould part (4) is rotated about the hinge line (7) such that its opening faces downwards towards the opening of the first mould part (2), the mould assembly further being provided with

displacement means for a rectilinear translational movement of the second mould part (4) between the second, partially closed position of the mould and a third position, in which the two mould parts (2, 4) meet so that their inner faces substantially define the shape of the finished profile member

characterised in that the displacement means are formed of protractile guide rods (8) mounted on one (2) of the two mould parts along the two longitudinal sides thereof extending substantially parallel to the hinge line (7), and associated bearing means (10) on the longitudinal sides of the other mould part (4) for receiving the free ends (9) of the guide rods (8) such that the second mould part (4) may rest on the 25 guide rods in the second position of the mould, the guide rods (8) including drive means (12) for displacing the guide rods (8) and thus moving the two mould parts (2, 4) between the second and third positions of the mould.

Claim 2 (original): Mould assembly according to claim 1, wherein the guide rods (8)

are provided with individually controllable drive means (12).

Claim 3 (currently amended): Mould assembly according to claim 1, wherein the free ends (9) of the guide rods (8) and optionally also the bearings bearing means (10) are conical.

Claim 4 (previously presented): Mould assembly according to claim 1, wherein the second mould part (4) is releasably attached to the hinge mechanism (6).

Claim 5 (currently amended): Mould assembly according claim 1, wherein both mould pails parts (2, 4) are provided with flanges (15, 16) along their longitudinal sides, said flanges having a plurality of pilot holes (20), whose axes are parallel to the axes of the guide rods (8), each pilot hole (20) in the flanges (16) of the first mould part (2) being arranged opposite a pilot hole in the flanges (15) of the second mould part (4).

Claim 6 (currently amended): Mould assembly according to claim 5 including guide pins (13) having two conical ends (18) adapted to engage two pilot of said holes (20) arranged opposite one 15 another in the flanges (15, 16) of the first mould part (2) and the second mould part (4).

Claim 7 (previously presented): Mould assembly according to claim 5, wherein the pilot holes (20) are provided in apertured members (14, 17), which are adjustably mounted on the flanges (15, 16) so as to enable displaceable adjustment thereof in the plane extending perpendicular to the axes of the pilot holes (20).

Claim 8 (original): Mould assembly according to claim 7, wherein the apertured members are shaped as circular discs (14, 17) each having an eccentric pilot hole (20).

Claim 9 (currently amended): Method of the use of a mould assembly according to claim 1, wherein the second mould part (4) is rotated by means of the hinge mechanism (6) from the first open position to the second partially closed

position, and men then displaced by means of the guide rods (8) from the second partially closed position to the third position, in which the two mould parts (2, 4) meet.

Claim 10 (original): Method according to claim 9, wherein the second mould part (4) subsequently is displaced by means of the guide rods (8) from the third closed position to the second partially closed position.

Claim 11 (currently amended): Method according to claim 10, wherein the guide rods (8) are operated such that the second mould part (4) is moved from the third closed position locally, e.g., at one end thereof, whereafter the remaining part of the second mould part (4) is moved from the third position.

Claim 12 (currently amended): Mould assembly according to claim 2, wherein the free ends (9) of the guide rods (8) and optionally also the bearings bearing means (10) are conical.

Claim 13 (previously presented): Mould assembly according to claim 2, wherein the second mould part (4) is releasably attached to the hinge mechanism (6).

Claim 14 (previously presented): Mould assembly according to claim 3, wherein the second mould part (4) is releasably attached to the hinge mechanism (6).

Claim 15 (currently amended): Mould assembly according claim 2, wherein both mould pails parts (2, 4) are provided with flanges (15, 16) along their longitudinal sides, said flanges having a plurality of pilot holes (20), whose axes are parallel to the axes of the guide rods (8), each pilot hole (20) in the flanges (16) of the first mould part (2) being arranged opposite a pilot hole in the flanges (15) of the second mould part (4).

Claim 16 (currently amended): Mould assembly according claim 3, wherein both mould pails parts (2, 4) are provided with flanges (15, 16) along

their longitudinal sides, said flanges having a plurality of pilot holes (20), whose axes are parallel to the axes of the guide rods (8), each pilot hole (20) in the flanges (16) of the first mould part (2) being arranged opposite a pilot hole in the flanges

Claim 17 (previously presented): Mould assembly according to claim 6, wherein

the pilot holes (20) are provided in apertured members (14, 17), which are adjustably

mounted on the flanges (15, 16) so as to enable displaceable adjustment thereof in the

plane extending perpendicular to the axes of the pilot holes (20).

Claim 18 (currently amended): Method of the use of a mould assembly according

to claim 2, wherein the second mould part (4) is rotated by means of the hinge mechanism

(6) from the first open position to the second partially closed position, and men then

displaced by means of the guide rods (8) from the second partially closed position to the third

position, in which the two mould parts (2, 4) meet.

(15) of the second mould part (4).

Claim 19 (new) A mould assembly according to claim 1 wherein said substantially

elongated, closed profile member comprises a wind turbine blade.

Claim 20 (new) A mould assembly according to claim 1 wherein in the first, open

position the openings of both mould parts face upwards.

7
